

Pain Points vs. Desired Gains

PAIN POINTS (CHALLENGES & BARRIERS)	GAINS (DESIRED OUTCOMES)
Raw Metric Overload: Data like 32.8°C, 63% humidity, and wind speed don't explicitly clarify what to wear or how to dress. Lack of Intelligence: Existing standard applications miss personalized recommendations and dynamic natural-language summaries.	Human-Readable Insights: Automated daily summaries and tailored advice (e.g., <i>"Stay hydrated, wear light cotton clothes..."</i>). Developer Efficiency: Seamless REST API backend endpoints providing reliable, structured weather context.

DOCUMENT 02

Customer Problem Statement Template

A structured breakdown framing the end-user and developer challenges to align feature development with real-world needs.

ID	I AM (USER)	I'M TRYING TO	BUT	BECAUSE	WHICH MAKES ME FEEL
PS-1	A daily commuter or traveler	Get clear, actionable weather advice before heading outside	Standard weather applications display only raw numerical data	Raw metrics don't state how to dress or prepare for daily travel	Frustrated and unprepared
PS-2	A developer building daily apps	Integrate intelligent weather insights into a platform	Traditional weather APIs require custom logic for human readable context	Free/standard weather APIs lack generative AI summaries & recommendations	Overwhelmed by complex integrations
